

5.2: Definite Integrals

In section 5.1, we assumed f was nonnegative on the interval $[a, b]$.

When $f(x) \leq 0$ on the interval $[a, b]$, then the area between $f(x)$ and the x -axis is negative.

Example. Consider the function $x^3 - 1$ on $[-2, 0]$. Using Riemann sums, we can approximate the area between the curve and the x -axis:

$$L_4 = f(-2)\frac{1}{2} + f(-1.5)\frac{1}{2} + f(-1)\frac{1}{2} + f(-0.5)\frac{1}{2} = -8.25$$

$$M_4 = f(-1.75)\frac{1}{2} + f(-1.25)\frac{1}{2} + f(-0.75)\frac{1}{2} + f(-0.25)\frac{1}{2} = -5.875$$

$$R_4 = f(-1.5)\frac{1}{2} + f(-1)\frac{1}{2} + f(-0.5)\frac{1}{2} + f(0)\frac{1}{2} = -4.25$$

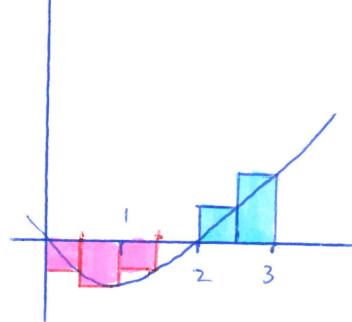

Actual area: -6

Definition. (Net Area)

Consider the region R bounded by the graph of a continuous function f and the x -axis between $x = a$ and $x = b$. The **net area** of R is the sum of the areas of the parts of R that lie above the x -axis *minus* the sum of the areas of the parts of R that lie below the x -axis on $[a, b]$.

Example. If $f(x) = x^2 - 2x$, $0 \leq x \leq 3$, evaluate the Riemann sum with $n = 6$, taking the sample points to be right endpoints.

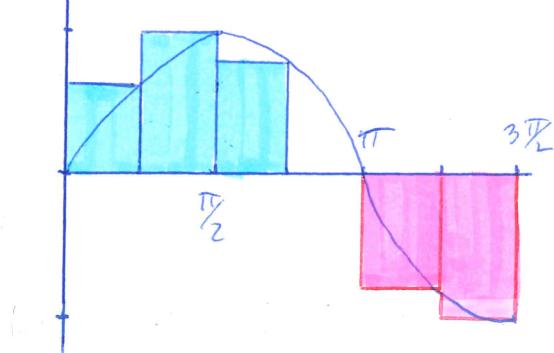

$$\Delta x = \frac{3-0}{6} = \frac{1}{2}$$

$$\begin{aligned} \sum_{k=1}^6 f(x_k) \Delta x &= f(x_1) \Delta x + f(x_2) \Delta x + f(x_3) \Delta x \\ &\quad + f(x_4) \Delta x + f(x_5) \Delta x + f(x_6) \Delta x \\ &= \frac{1}{2} (-0.75 - 1 - 0.75 + 0 + 1.25 + 3, 0) \\ &= \frac{1}{2} (1.75) = 0.875 = \boxed{\frac{7}{8}} \end{aligned}$$

Example. Find the Riemann sum for $f(x) = \sin(x)$, $0 \leq x \leq \frac{3\pi}{2}$, with six terms, taking the sample points to be right endpoints.

$$\Delta x = \frac{\frac{3\pi}{2} - 0}{6} = \frac{\pi}{4}$$

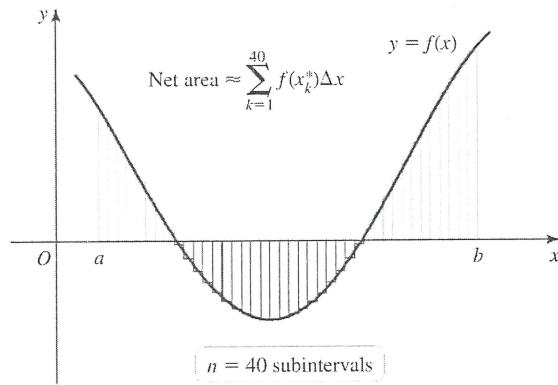

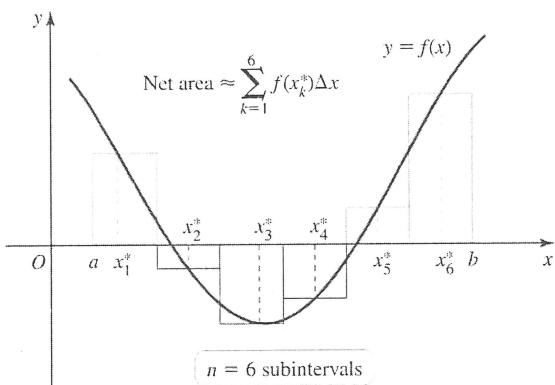

$$\begin{aligned} \sum_{k=1}^6 f(x_k) \Delta x &= \frac{\pi}{4} \left(\frac{\sqrt{2}}{2} + 1 + \frac{\sqrt{2}}{2} + 0 - \frac{\sqrt{2}}{2} - 1 \right) \\ &= \boxed{\frac{(\sqrt{2}+2)\pi}{8}} \end{aligned}$$

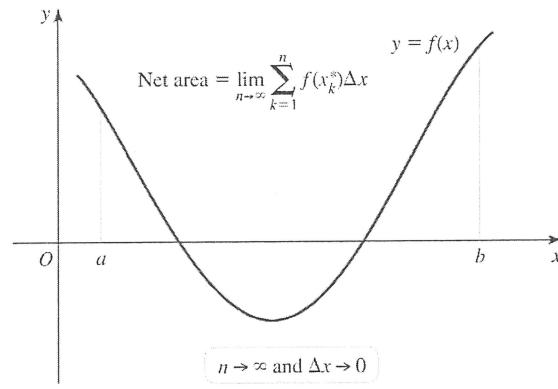

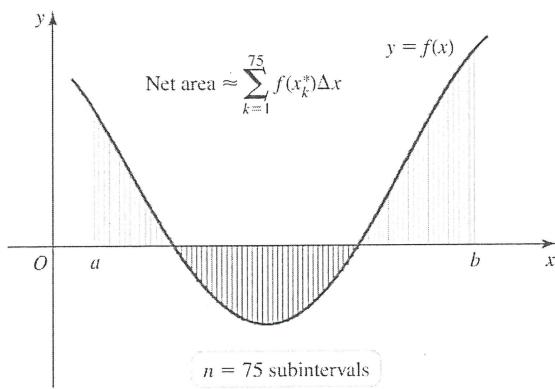

Definition. (Definite Integral)

A function f defined on $[a, b]$ is **integrable** on $[a, b]$ if $\lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x_k$ exists and is unique over all partitions of $[a, b]$ and all choices of x_k^* on a partition. This limit is the **definite integral of f from a to b** , which we write

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k^*) \Delta x_k$$

As the number of subintervals n increases, the Riemann sums approach the net area of the region between the curve $y = f(x)$ and the x -axis on $[a, b]$.

Example.

- a) For the function $f(x) = 3x + 2x^2$, find a formula for the upper sum obtained by dividing the interval $[0, 1]$ into n equal subintervals.

$$\Delta x = \frac{1-0}{n} = \frac{1}{n}$$

$$x_k = 0 + k\Delta x = \frac{k}{n}$$

$$f(x_k) = \frac{3k}{n} + \frac{2k^2}{n^2}$$

$$\begin{aligned} \sum_{k=1}^n f(x_k) \Delta x &= \sum_{k=1}^n \left(\frac{3k}{n} + \frac{2k^2}{n^2} \right) \frac{1}{n} \\ &= \frac{3}{n^2} \sum_{k=1}^n k + \frac{2}{n^3} \sum_{k=1}^n k^2 \\ &= \frac{3}{n^2} \frac{n(n+1)}{2} + \frac{2}{n^3} \frac{n(n+1)(2n+1)}{6} \\ &= \frac{3(n+1)}{2n} + \frac{2n^2+3n+1}{3n^2} \end{aligned}$$

- b) Take the limit of the sum as $n \rightarrow \infty$ to calculate the area under $f(x) = 3x + 2x^2$ over $[0, 1]$.

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x &= \lim_{n \rightarrow \infty} \frac{3(n+1)}{2n} + \frac{2n^2+3n+1}{3n^2} \\ &= \frac{3}{2} + \frac{2}{3} = \boxed{\frac{13}{6}} \end{aligned}$$

Example. Use the limit of the Riemann sum notation to evaluate $\int_0^2 (2 - x^2) dx$.

$$\Delta x = \frac{2-0}{n} = \frac{2}{n}$$

$$x_k = 0 + k\Delta x = \frac{2k}{n}$$

$$f(x_k) = 2 - \left(\frac{2k}{n}\right)^2 = 2 - \frac{4k^2}{n^2}$$

$$\sum_{k=1}^n \left(2 - \frac{4k^2}{n^2}\right) \frac{2}{n} = \frac{1}{n} \sum_{k=1}^n 4 - \frac{8}{n^3} \sum_{k=1}^n k^2 = 4 - \frac{8}{n^3} \frac{n(n+1)(2n+1)}{6}$$

$$= 4 - \frac{4(2n^2+3n+1)}{3n^2}$$

$$\int_0^2 (2-x^2) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x = \lim_{n \rightarrow \infty} 4 - \frac{4(2n^2+3n+1)}{3n^2} = 4 - \frac{8}{3} = \boxed{\frac{4}{3}}$$

Example. Use the definition of the definite integral to evaluate $\int_1^4 (x^2 - 1) dx$.

$$\Delta x = \frac{4-1}{n} = \frac{3}{n}$$

$$x_k = 1 + k\Delta x = 1 + \frac{3k}{n}$$

$$f(x_k) = \left(1 + \frac{3k}{n}\right)^2 - 1 = \frac{6k}{n} + \frac{9k^2}{n^2}$$

$$\sum_{k=1}^n \left(\frac{6k}{n} + \frac{9k^2}{n^2}\right) \frac{3}{n} = \sum_{k=1}^n \frac{18k}{n^2} + \frac{27k^2}{n^3} = \frac{18}{n^2} \sum_{k=1}^n k + \frac{27}{n^3} \sum_{k=1}^n k^2$$

$$= \frac{9(n+1)}{n} + \frac{9(2n^2+3n+1)}{2n^2}$$

$$\int_1^4 x^2 - 1 dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x = \lim_{n \rightarrow \infty} \frac{9(n+1)}{n} + \frac{9(2n^2+3n+1)}{2n^2}$$

$$= 9 + 9 = \boxed{18}$$

Example. Use the definition of the definite integral to evaluate $\int_1^4 (x^2 - 4x + 2) dx$.

$$\Delta x = \frac{4-1}{n} = \frac{3}{n}$$

$$x_k = 1 + k\Delta x = 1 + \frac{3k}{n}$$

$$f(x_k) = (1 + \frac{3k}{n})^2 - 4(1 + \frac{3k}{n}) + 2 = \frac{9k^2}{n^2} - \frac{6k}{n} - 1$$

$$\begin{aligned} \sum_{k=1}^n f(x_k) \Delta x &= \sum_{k=1}^n \left(\frac{9k^2}{n^2} - \frac{6k}{n} - 1 \right) \frac{3}{n} = \frac{27}{n^3} \sum_{k=1}^n k^2 - \frac{18}{n^2} \sum_{k=1}^n k - \frac{3}{n}(n) \\ &= \frac{9(2n^2+3n+1)}{2n^2} - \frac{18(n+1)}{n} - 3 \end{aligned}$$

$$\int_1^4 (x^2 - 4x + 2) dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x = \lim_{n \rightarrow \infty} \frac{9(2n^2+3n+1)}{2n^2} - \frac{9(n+1)}{n} - 3 = 9 - 9 - 3 = \boxed{-3}$$

Example. Use the definition of the definite integral to evaluate $\int_0^2 4x^3 dx$.

$$\Delta x = \frac{2-0}{n} = \frac{2}{n}$$

$$x_k = 0 + k\Delta x = \frac{2k}{n}$$

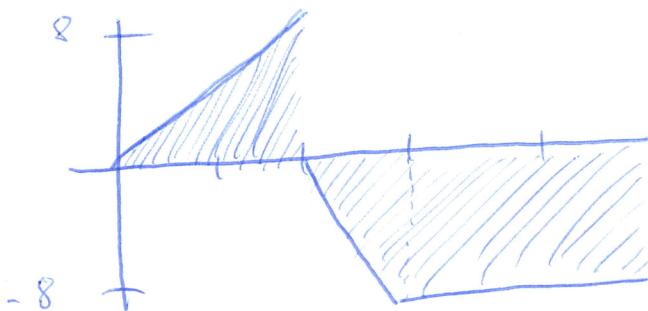

$$f(x_k) = 4 \left(\frac{2k}{n} \right)^3 = \frac{32k^3}{n^3}$$

$$\sum_{k=1}^n f(x_k) \Delta x = \sum_{k=1}^n \left(\frac{32k^3}{n^3} \right) \left(\frac{2}{n} \right) = \frac{64}{n^4} \sum_{k=1}^n k^3 = \frac{64}{n^4} \cdot \frac{n^2(n+1)^2}{4} = \frac{16(n+1)^2}{n^2}$$

$$\int_0^2 4x^3 dx = \lim_{n \rightarrow \infty} \sum_{k=1}^n f(x_k) \Delta x = \lim_{n \rightarrow \infty} \frac{16(n+1)^2}{n^2} = \boxed{16}$$

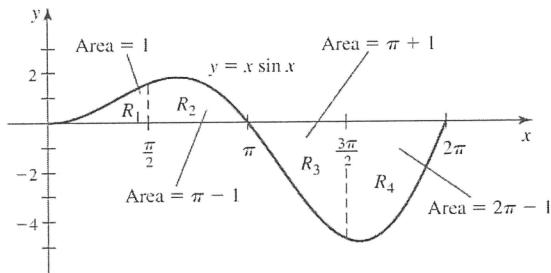

Example. Use a sketch and geometry to evaluate the following integral

$$\int_1^{10} g(x) dx, \text{ where } g(x) = \begin{cases} 4x, & \text{if } 0 \leq x \leq 2 \\ -8x + 16, & \text{if } 2 < x \leq 3 \\ -8, & \text{if } x > 3 \end{cases}$$

$$\int_1^{10} g(x) dx = \frac{1}{2}(2+8) + \frac{1}{2}(-8+7)(-8) = -55$$

Example. For the following figure to evaluate the integrals below:

$$a) \int_0^\pi x \sin(x) dx = R_1 + R_2 = 1 + (\pi - 1) = \textcircled{7}$$

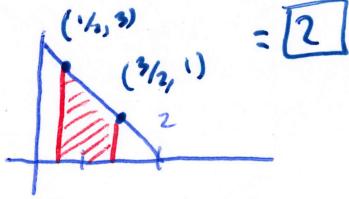

$$b) \int_0^{3\pi/2} x \sin(x) dx = R_1 + R_2 - R_3 = 1 + (\pi - 1) - (\pi + 1) = \textcircled{-1}$$

$$\begin{aligned} c) \int_0^{2\pi} x \sin(x) dx &= R_1 + R_2 - R_3 - R_4 \\ &= 1 + (\pi - 1) - (\pi + 1) - (2\pi - 1) \\ &= \textcircled{-2\pi} \end{aligned}$$

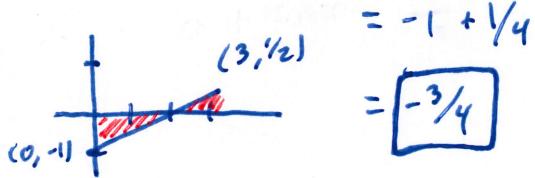

$$\begin{aligned} d) \int_{\pi/2}^{2\pi} x \sin(x) dx &= R_2 - R_3 - R_4 \\ &= (\pi - 1) - (\pi + 1) - (2\pi - 1) \\ &= \textcircled{-1 - 2\pi} \end{aligned}$$

Example. Graph the following integrands and compute the areas to evaluate the integrals.

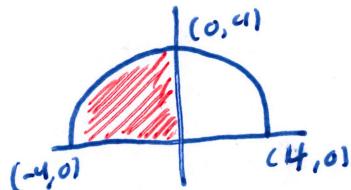

$$a) \int_{1/2}^{3/2} (-2x + 4) dx = \frac{1}{2}(3+1) \cdot 1$$

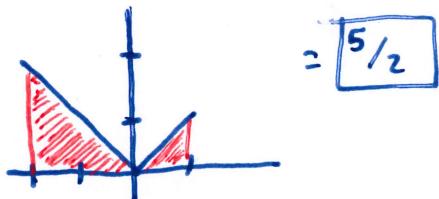

$$c) \int_0^3 \left(\frac{1}{2}x - 1\right) dx = -\frac{1}{2}(1)(2) + \frac{1}{2}\left(\frac{1}{2}\right)(1)$$

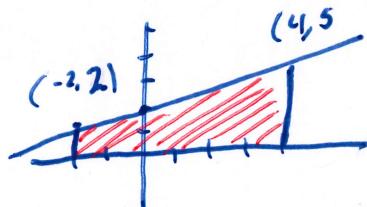

$$e) \int_{-4}^0 \sqrt{16 - x^2} dx = \frac{1}{4} \pi (4)^2 = 4\pi$$

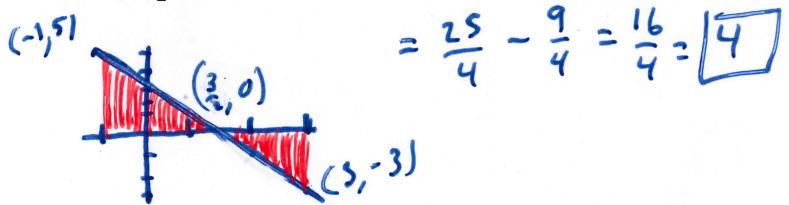

$$g) \int_{-2}^1 |x| dx = \frac{1}{2}(2)(2) + \frac{1}{2}(1)(1)$$

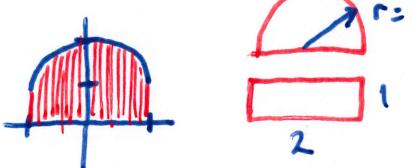

$$b) \int_{-2}^4 \left(\frac{x}{2} + 3\right) dx = \frac{1}{2}(2+5)6 = 21$$

$$d) \int_{-1}^3 (3 - 2x) dx = \frac{1}{2}\left(\frac{5}{2}\right)(5) - \frac{1}{2}\left(\frac{3}{2}\right)(3)$$

$$f) \int_{-1}^1 \left(1 + \sqrt{1 - x^2}\right) dx = (1)(2) + \frac{1}{2}\pi(1)^2$$

$$h) \int_{-1}^1 (2 - |x|) dx = \frac{1}{2}(1+2)(1) + \frac{1}{2}(2+1)(1) = 3$$

Properties of definite integrals

Let f and g be integrable functions on an interval that contains a , b , and p .

$$1. \int_a^a f(x) dx = 0$$

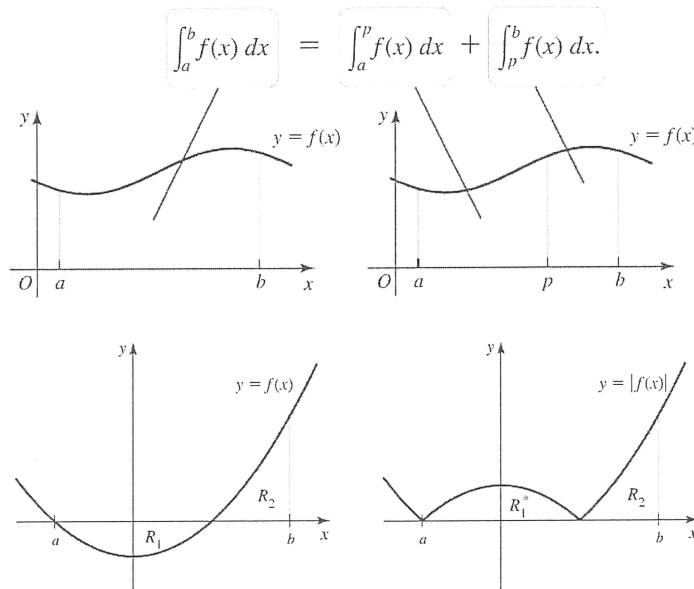

$$2. \int_a^b f(x) dx = - \int_b^a f(x) dx$$

$$3. \int_a^b (f(x) \pm g(x)) dx = \int_a^b f(x) dx \pm \int_a^b g(x) dx$$

$$4. \int_a^b cf(x) dx = c \int_a^b f(x) dx, \text{ for any constant } c$$

$$5. \int_a^b f(x) dx = \int_a^p f(x) dx + \int_p^b f(x) dx$$

6. The function $|f|$ is integrable on $[a, b]$ and $\int_a^b |f(x)| dx$ is the sum of the areas of the regions bounded by the graph of f and the x -axis on $[a, b]$.

Example. Suppose that $\int_{-3}^0 g(t) dt = \sqrt{2}$. Evaluate the following:

$$\text{a)} \int_{-3}^0 g(u) du = \boxed{\sqrt{2}}$$

$$\text{b)} \int_0^{-3} g(t) dt = - \int_{-3}^0 g(t) dt = \boxed{-\sqrt{2}}$$

$$\begin{aligned} \text{c)} \int_0^{-3} [-g(x)] dx &= - \int_0^{-3} g(x) dx \\ &= \int_{-3}^0 g(x) dx = \boxed{\sqrt{2}} \end{aligned}$$

$$\begin{aligned} \text{d)} \int_{-3}^0 \frac{g(r)}{\sqrt{2}} dr &= \frac{1}{\sqrt{2}} \int_{-3}^0 g(r) dr \\ &= \frac{1}{\sqrt{2}} \cdot \sqrt{2} = \boxed{1} \end{aligned}$$

Example. Suppose that $\int_0^3 f(z) dz = 3$ and $\int_0^4 f(z) dz = 7$. Evaluate the following:

$$\begin{aligned} \text{a)} \int_3^4 f(z) dz &= \int_0^4 f(z) dz - \int_0^3 f(z) dz \\ &= 7 - 3 = \boxed{4} \end{aligned}$$

$$\begin{aligned} \text{b)} \int_4^3 f(z) dz &= - \int_3^4 f(z) dz \\ &= \boxed{-3} \end{aligned}$$

Example. Use the fact that $\int_0^{\pi/2} (\cos(\theta) - 2\sin(\theta)) d\theta = -1$ to evaluate the following

$$\text{a)} \int_0^{\pi/2} (2\sin(\theta) - \cos(\theta)) d\theta$$

$$= \int_0^{\pi/2} (\cos(\theta) - 2\sin(\theta)) d\theta$$

$$= -(-1) = \boxed{1}$$

$$\text{b)} \int_{\pi/2}^0 (4\cos(\theta) - 8\sin(\theta)) d\theta$$

$$= - \int_0^{\pi/2} 4(\cos(\theta) - 2\sin(\theta)) d\theta$$

$$= -4 \int_0^{\pi/2} (\cos(\theta) - 2\sin(\theta)) d\theta = -4(-1) = \boxed{4}$$

Example. Suppose that $\int_1^9 f(x) dx = -1$, $\int_7^9 f(x) dx = 5$ and $\int_7^9 h(x) dx = 4$. Evaluate the following:

$$\text{a)} \int_1^9 -2f(x) dx = -2 \int_1^9 f(x) dx$$

$$= -2(-1) = \boxed{2}$$

$$\text{b)} \int_7^9 [f(x) + h(x)] dx$$

$$= \int_7^9 f(x) dx + \int_7^9 h(x) dx = 4 + 5 = \boxed{9}$$

$$\text{c)} \int_7^9 [2f(x) - 3h(x)] dx$$

$$= 2 \int_7^9 f(x) dx - 3 \int_7^9 h(x) dx$$

$$= 2(5) - 3(4) = \boxed{-2}$$

$$\text{d)} \int_9^1 f(x) dx = - \int_1^9 f(x) dx$$

$$= -(-1) = \boxed{1}$$

$$\text{e)} \int_1^7 f(x) dx$$

$$= \int_1^9 f(x) dx - \int_7^9 f(x) dx$$

$$= -1 - 5 = \boxed{-6}$$

$$\text{f)} \int_7^9 [h(x) - f(x)] dx$$

$$= \int_7^9 h(x) dx - \int_7^9 f(x) dx$$

$$= 4 - 5 = \boxed{-1}$$

Example. Given $\int_1^3 e^x dx = e^3 - e$, find $\int_1^3 (2e^x - 1) dx$

$$\begin{aligned} \int_1^3 2e^x - 1 dx &= 2 \int_1^3 e^x dx - \int_1^3 1 dx \\ &= 2(e^3 - e) - (3 - 1) = \boxed{2e^3 - 2e - 2} \end{aligned}$$

Example. Suppose that $f(x) \geq 0$ on $[0, 2]$ and $f(x) \leq 0$ on $[2, 5]$ where $\int_0^2 f(x) dx = 6$ and $\int_2^5 f(x) dx = -8$. Evaluate the following:

a) $\int_0^5 f(x) dx$

$$= \int_0^2 f(x) dx + \int_2^5 f(x) dx$$

$$= 6 + (-8) = \textcircled{-2}$$

b) $\int_0^5 |f(x)| dx$

$$= \int_0^2 |f(x)| dx + \int_2^5 |f(x)| dx$$

$$= |6| + |-8| = \boxed{14}$$

c) $\int_2^5 4|f(x)| dx$

$$= 4 \int_2^5 |f(x)| dx$$

$$= 4|-8| = \boxed{32}$$

d) $\int_0^5 (f(x) + |f(x)|) dx$

$$= \int_0^2 f(x) dx + \int_2^5 |f(x)| dx$$

$$= -2 + 14$$

$$= \boxed{12}$$
